

Datasheet

5550 & 5550G Mechanical Vibration Switches

Overview

Model 5550 and 5550G mechanical switches provide basic, economical vibration protection by means of a simple and highly reliable "over center" snap action mass and spring mechanism. In the presence of sufficient vibration along the switch's sensitive axis, the switch snaps from a stable "untripped" state to a stable "tripped" state, allowing automatic machinery shutdown or alarming when excessive vibration occurs. Once tripped, the switch must be returned to its untripped state via its local reset plunger (5550 only), or via voltage applied to its remote reset coil (standard on 5550G, optional on 5550). A single set of silver-plated SPDT relay contacts are provided as standard for connecting the switch to a machine control or annunciation circuit. An option for DPDT contacts is also available, and for extremely corrosive environments, gold-plated relay contacts may be ordered.

Model 5550

Key Feature Comparison

	5550	5550G
IECEx / ATEX Flameproof up to Gas Group Rating IIB + H ₂	Optional	Standard
IECEx / ATEX Flameproof up to Gas Group Rating IIC	Not Available	Standard
UL / cUL Explosion Proof Ratings for Div 1 areas	Optional	Not Available
Remote Reset / Startup Delay	Optional	Standard
Setpoint Adjustment Screw	Externally Accessible	Internally Accessible
Reset	Local (Std) and Remote (Opt)	Remote Only
NEMA 4 / IP66 Rating	Standard	Standard
NEMA 4X / IP66 Rating	Optional	Standard
Mounting Footprint	Rectangular, 4-hole	Rectangular, 2-hole
CE Mark	Standard	Standard

5550 & 5550G Mechanical Vibration Switches

Selection Criteria

The 5550 and 5550G use identical internal mechanisms and differ only in their housing styles, mounting footprints, hazardous area ratings, and externally accessible features.

While the housing used with the 5550G permits its use in the more highly explosive IIC gas group, it is not available with a local reset plunger or with an externally accessible setpoint adjustment screw. The 5550G also occupies a larger mounting footprint. For these reasons, the 5550 is generally the preferred choice except in applications where the IIC gas group is present.

Setpoint Adjustment

The switch's trip point can be adjusted between 0 and 16 g's (peak) in increments of approx. 1 g (1/8th turn of setpoint adjustment screw). This adjustment screw is externally accessible on the 5550. On the 5550G, the housing's cover must be removed to access the adjustment screw.

Remote Reset / Startup Delay

A remote reset / startup delay feature is standard on the 5550G and optional on the 5550. When the switch's reset terminals are energized, a solenoid is activated. This solenoid will reset the switch (if in its tripped state) and then hold it in this untripped state for approximately 30 seconds*, after which normal operation of the switch resumes. This feature is useful for machines that exhibit higher-than-normal vibration during startup and need to suppress tripping functions until normal operating speeds and conditions have been

reached. The holding strength of this solenoid must be properly specified at time of ordering to ensure it can force the switch into an untripped position and hold it there for the duration of the startup delay, even in the presence of high vibration levels (see ordering option C).

*NOTE: It is not possible to indefinitely prolong the duration of the startup delay by continuously applying voltage to the reset terminals. The duration is set at the factory for approximately 30 seconds and uses a thermistor circuit. Consult the manual for additional details and recommendations for using both the reset and startup delay features.

NOTE: Mechanical vibration switches rely on inertial forces (acceleration) to actuate the trip mechanism. Thought should be given to the amount of seismic acceleration that will occur under machinery malfunction conditions and whether it will be sufficient to reliably actuate a mechanical switch. In particular, the relationship between acceleration, velocity, and displacement is such that at low frequencies, very large peak-to-peak displacements (in excess of 50mm) are required to generate the acceleration amplitudes (0.5 g or greater) detectable by a mechanical switch. Care should be taken when measuring vibration frequencies below 10 Hz (600 rpm) to understand the levels of structural displacement, velocity, and acceleration that are generated at the frequency(ies) of interest. These should be compared to maximum allowable vibration levels for the machine or structure to determine whether the setpoint adjustment resolution of a mechanical switch will provide suitable results for the application.

In some instances, seismic velocity may be a better measurement. It also has the advantage of allowing integration to displacement units when total structural displacement is of interest. When seismic velocity or displacement measurements are more suitable for the application, a mechanical switch cannot provide these measurements. Instead, Metrix can provide electronic vibration switches, 4-20 mA transmitters, or stand-alone monitoring systems. Consult with your nearest Metrix sales professional who can review your application and assist with selection of the proper instrumentation.

5550 & 5550G Mechanical Vibration Switches

Specifications

All specifications are at +25C (+77° F) unless otherwise noted.

5550	
	
Amplitude Range	0 to 16 g pk NOTE: Reset coil holding strength (option C) may limit the usable amplitude range of the switch when the startup delay feature is required.
Frequency Range	0 – 60 Hz (0 – 3600 rpm)
Setpoint Adjustment	Location Externally Accessible
	Resolution 1g (approximately 1/8 th turn of adjustment screw where one full turn ≈ 8g)
	Range 0 – 100% of amplitude range
	Wiring Entries Two (3/4" NPT or M20 x 1.5 – see option E)
Local Reset	Manual plunger-style pushbutton on switch housing
Temperature Limit	-40° C to +70° C (-40° F to +158° F)
Mounting	4-hole rectangular in various dimensional options (see Figure 1 and option E)

Remote Electrical Reset / Startup Delay	Optional (see option D). Applying a momentary voltage to the reset terminals will reset the switch to its untripped position. Applying a persistent voltage to the reset terminals will suppress the trip mechanism from actuating for the duration of voltage application or 30 seconds, whichever is less (a thermistor circuit limits the maximum delay time).	
Reset Coil Holding Strength	2g, 5g, or 10g (see option C). This option dictates the highest g-levels under which remote reset / startup delay capabilities will still operate.	
Enclosure Material	<ul style="list-style-type: none"> • Copper-free cast aluminum (standard NEMA 4 version) • Copper-free cast aluminum with clear epoxy coating (optional NEMA 4X version) 	
Environment Rating	<ul style="list-style-type: none"> • NEMA 4 / IP66 (standard) • NEMA 4X / IP66 (optional) 	
Hazardous Area Rating	Explosion Proof / Flameproof (see ordering option A)	
Agency Certifications	UL / cUL Class I Div 1 Grps B,C,D Class II Div 1 Grps E,F,G	
	ATEX / IECEx Ex d IIB + H ₂ T6	
	INMETRO BR-Ex d IIB + H ₂ T6	
Weight	1.8 kg (4.0 lbs)	
Contacts	Type	
	<ul style="list-style-type: none"> • SPDT (standard) • DPDT (optional) 	
	Plating Material	
	<ul style="list-style-type: none"> • Silver (standard) • Gold (optional)

3	3/4" NPT / Metrix 5078 or 365
4	M20 x 1.5 / Metrix 5097, VS-2 EX, or 366
6	M20 x 1.5 / Metrix 5173 or 5175
7	3/4" NPT / Metrix or PMC-BETA 440
8	M20 x 1.5 / Metrix 5078 or 365

F Environmental Rating⁶

0	NEMA 4 / IP66
1	NEMA 4X / IP66

NOTES:

- Options A=0 through A=4 are only compatible with B=1 or B=2. Options A=5 through A=9 are only compatible with B=3 or B=4.
- INMETRO approvals (A=10 or A=11) available with silver relay contacts only (B=1 or B=2)
- UL / cUL approvals require tapered threads for conduit and are not compatible with option E=4, 6, or 8.
- When options C=2 and D=3 are simultaneously specified (2g, 24Vdc reset coil), the switch sensitive axis (see Figure 1) MUST be oriented vertically with the cover facing up. This coil lacks sufficient holding strength to support the trip plate when the switch is mounted horizontally or upside down. The switch may be mounted at any orientation for all other options.
- Consult Figure 1 for mounting plate dimensions corresponding to E options.
- If left blank, option 0 is provided.
- When D=0 (no reset /startup delay coil), the C option is ignored regardless of which value is selected. All switches ship with a full-scale range of approximately 16gs.
